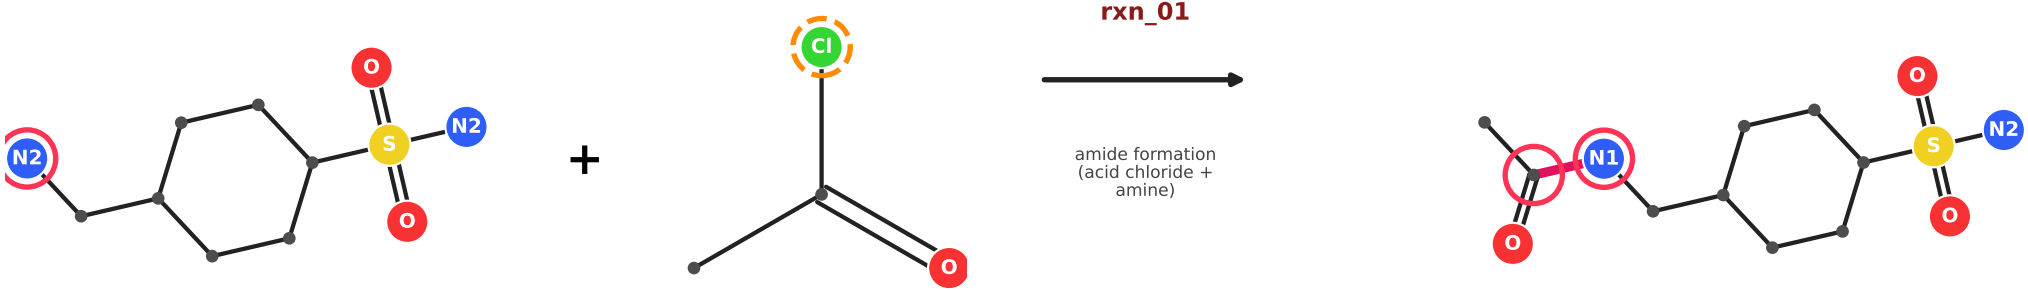
Step 1 — actual certified reaction equation · amide formation (acid chloride + amine) · family: amide_and_carbamate

Current intermediate (M0)
NCc1ccc(S(N)(=O)=O)cc1

Incoming building block
REC0176965 · CC(=O)Cl

Resulting intermediate (M1)
CC(=O)NCc1ccc(S(N)(=O)=O)cc1



certified SMARTS: [NX3;H2,H1:4].[CX3:1](=[OX1:2])[Cl:3]>>[CX3:1](=[OX1:2])[NX3:4]
new bond formed: single (junction); leaving (block side): chloride (deleted); leaving (molecule side): none (molecule-side amines react without leaving atoms)
catalyst/conditions: not specified by the certified template
mechanism: nucleophilic acyl substitution at an acid chloride; the amide C-N partial double bond pins the junction planar trans (resonance lock)
